Cloud is a glass globe pendant which provides a gradient light that is amplified downwards.

The characteristic silhouette resembles a cloud and several lamps together appear asymmetric when viewed from different angles and distances. The concept is a development of the common pendant globe. Instead of using a strict symmetric shape which looks identical from all angles it has a curved shape that will change appearance from different positions in a room. To avoid light from flooding the ceiling traditional globes use a wide fixture to block the top.

Cloud is instead equipped with a light filter that creates a decorative gradient illumination and attenuates the upward light.
